

Every 99 minutes

In December the Bureau of Labor Statistics (BLS, an agency of the United States government) released its "National Census of Fatal Occupational Injuries in 2023."

Working people deserve to read this report (ten pages, mostly tables and charts) and to discuss it.

The report:

- only covers the United States.
- reports counts of confirmed job-related deaths, not survey results.
- covers 2023, over a year ago.

Some key points:

- Jobs have killed about 5,000 workers every year for a decade.
- Jobs killed 5,283 workers in 2023, down 3.7% from the recent high of 5,486 in 2022.
- The number of working people changes each year, but the rate at which jobs kill us remains remarkably constant.
- "A worker died every 99 minutes from a work-related injury in 2023 compared to 96 minutes in 2022."
- Women die from work-related homicides more than twice as often as men.

The report and its related data on the BLS website offer breakdowns of the numbers by industry and by demographics of the people who died.

The report doesn't ask the most important question: *Why* do these workplace deaths happen?
